Leonardo Project

Honglin Li

Project Leader: Dr Yan Sun

What is an ornithopter

A heavier-than-air aircraft with wings that flap up and down like those of a bird

Project introduction

Realizing Da Vinci's idea of ornithopter

The bird is a machine which works on mathematical principles, and man is capable of imitating this machine including all its movements.

-Leonardo da Vinci

Multi—link

Mechanical analysis and vibration model of Multi-link

Power System

power system

flying frequency of dove

Design frequency of the aircraft: 2Hz

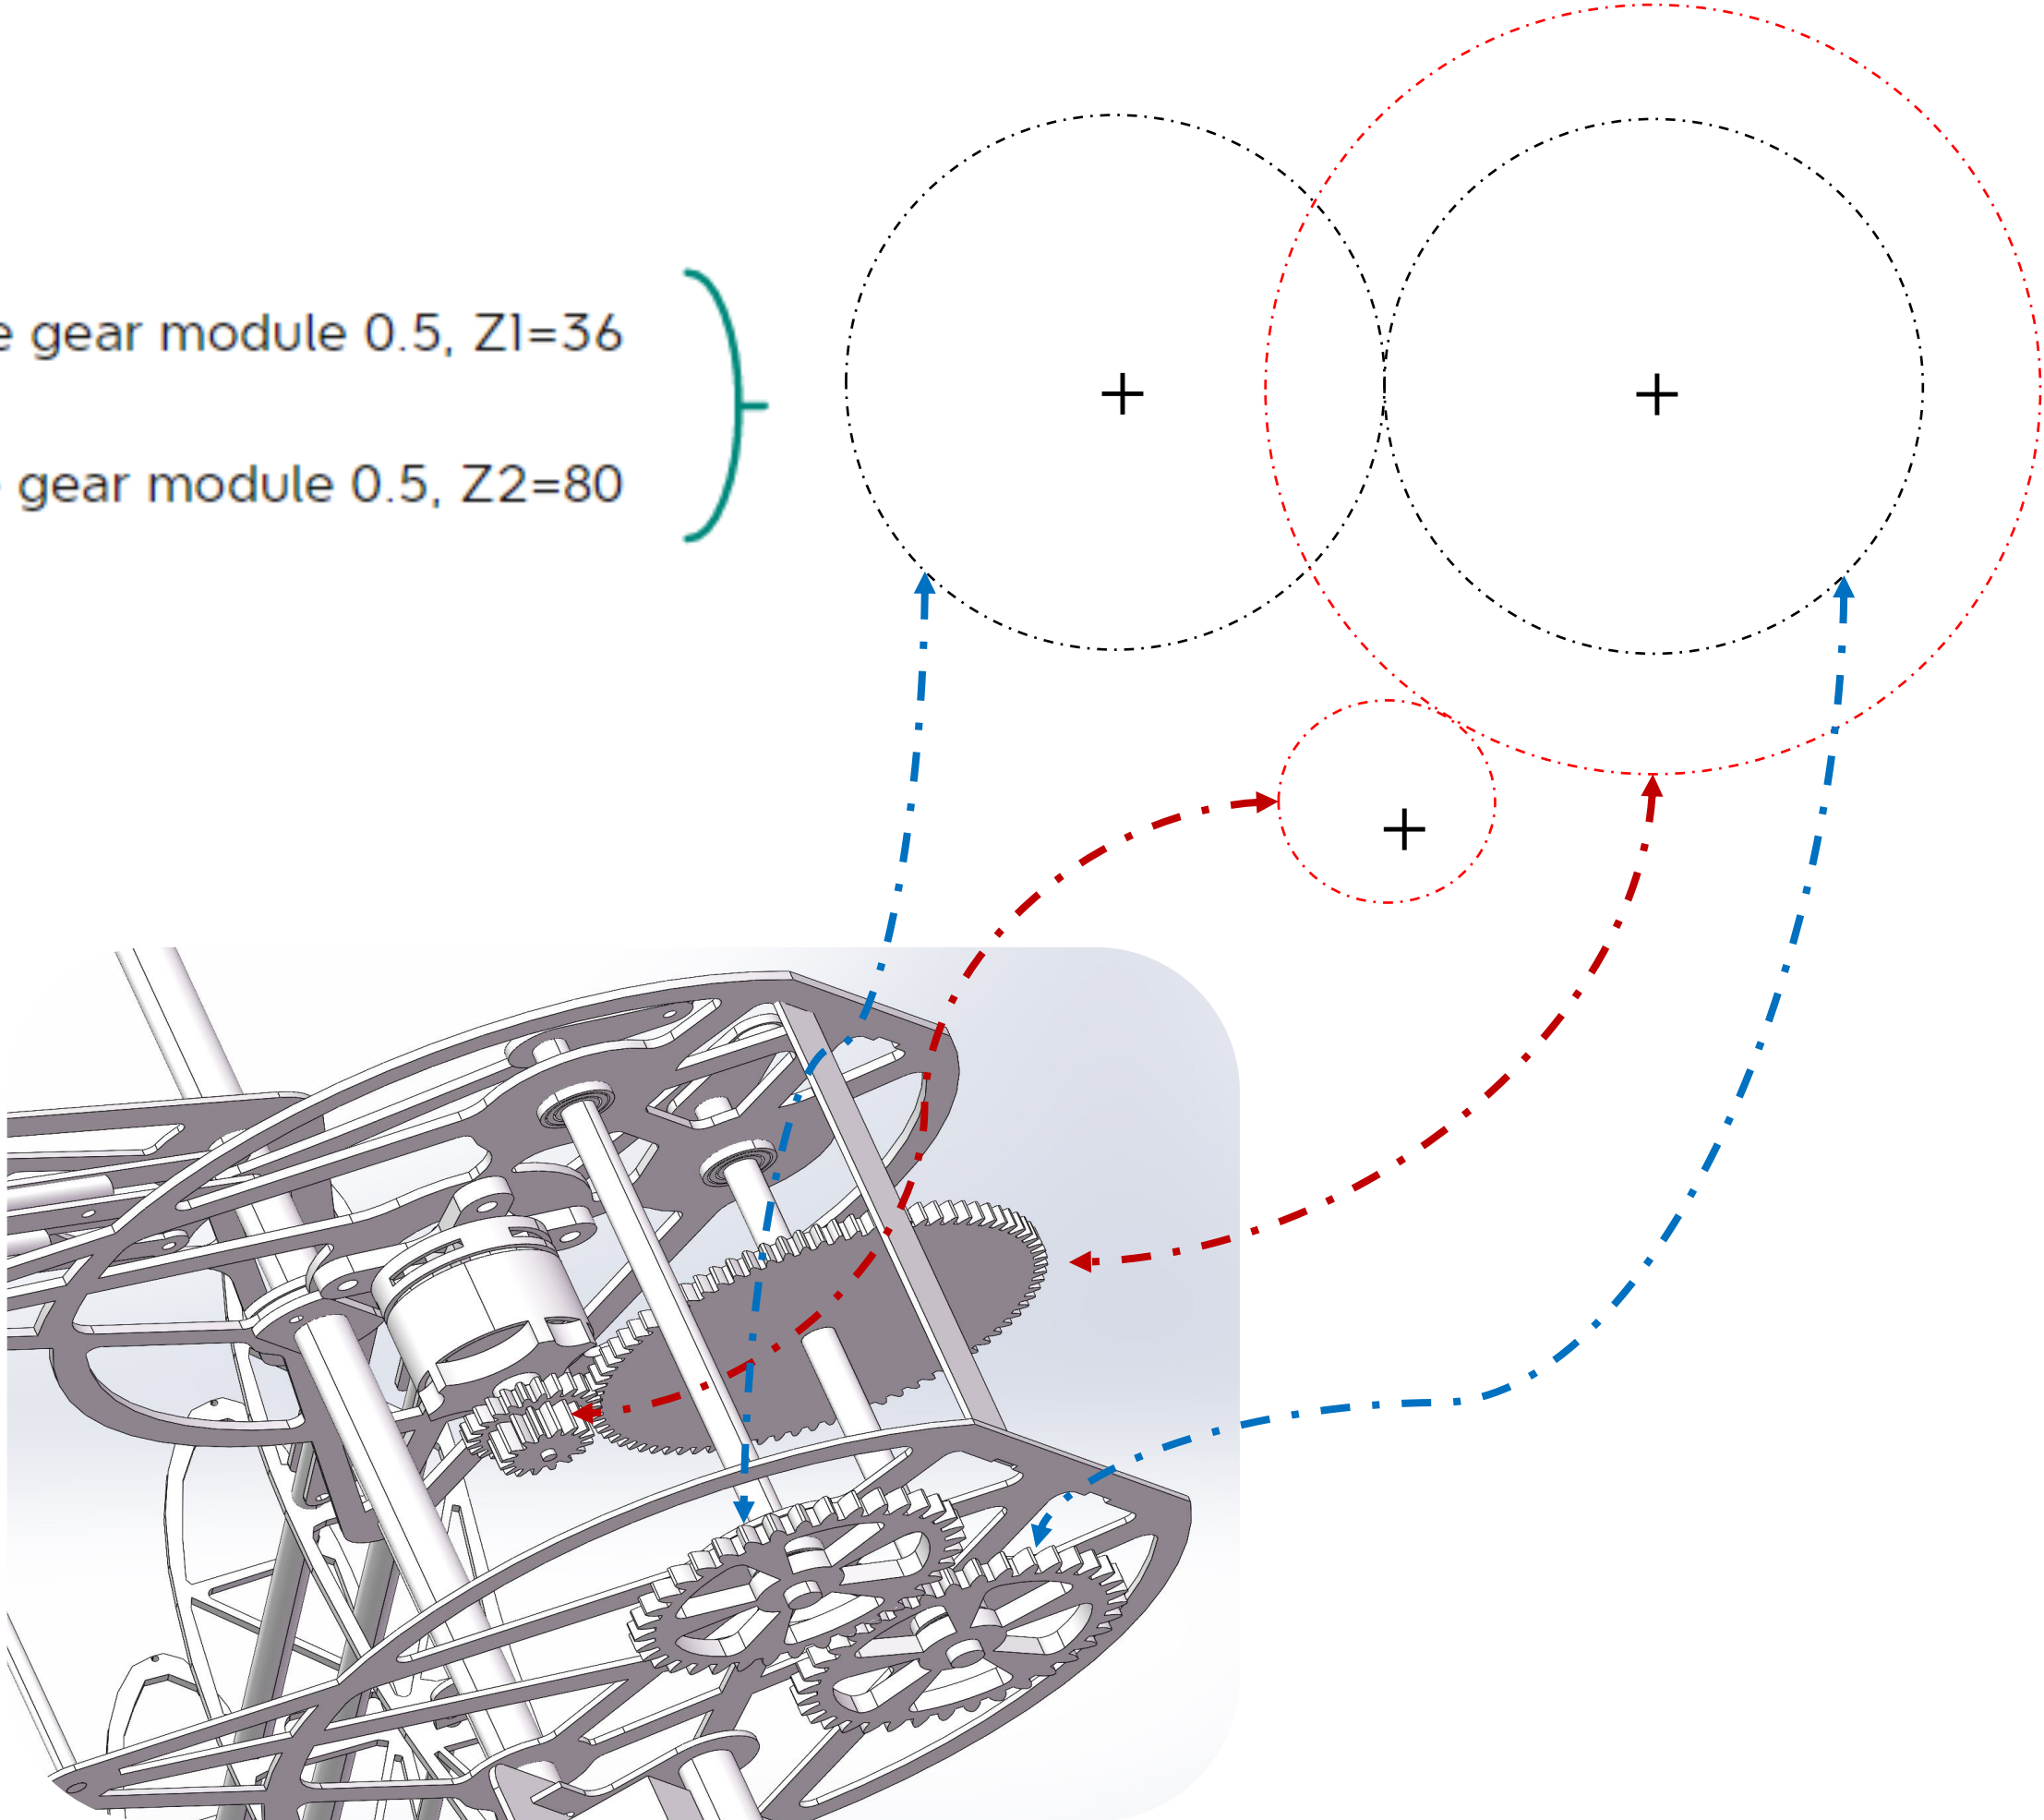

The gear parameters

Blue drive gear module 0.5, $Z_1=36$

Red drive gear module 0.5, $Z_2=80$

The transmission ratio is 47.6.

The motor speed: $n=5712\text{r/min}$

Pneumatic & Material

K R Y P O I N T

The experimental design

✓ **Background and Target**

There is a mature ornithopter, relevant sensors...

Get a lot of data, build models

✓ **The data collection**

Load core sensors and collect the rest by ground equipment

Use Bluetooth and data line, Python climb, MATLAB analysis

Pre condition

Sequence	Pre condition
1	Keep no wind , standard temperature and humidity environment
2	Fixed different wind speed , keep wind direction and standard temperature and humidity environment
3	Fixed different wind speed, keep wind direction and standard temperature and humidity environment
4	Keep no wind, standard temperature and humidity environment, fixed different brightness
5	Fixed wind speed, switch wind direction and standard temperature and humidity environment
6	Switch wind direction, wind speed and standard temperature and humidity environment
7	Keep calm in icy conditions

Purchasing items

The equipment number	items	Attachme nt methods
1	Hanwang ornithopter	/
2	Six-axis Bluetooth accelerometer	belly
3	anemometer	ground
4	Light sensitive switch	ground
5	Tension meter	ground
6	farmar	belly

The experiment plan

Senoral number	pre condition		The equipment number	Constant in this case	independent variable	dependent variable	independent variable	dependent variable	independent variable	dependent variable	independent variable	dependent variable					
1	1/2 /3/4 /5/6 /7	Measure the lift generated by the vehicle under full power operation	1、 5	lift	/	/	/	/	/	/	/	/					
2		Measure the lift force generated by the aircraft under full power operation (with acceleration sensor)	1、 2、 5	lift	/	/	/	/	/	/	/	/					
3		Measure the influence of different angles (three gears) of the aircraft tail on flight speed and acceleration under full power operation	1、 2	lift	Wing Angle 1	Velocity	Wing Angle 2	Velocity	Wing Angle 3	Velocity	Wing Angle 3	Velocity	Wing Angle 3				
														v1	v2	v3	v4
														v11222	v22	v33	v44
														acceleration	acceleration	acceleration	acceleration
														a1	a2	a3	a4
		a11	a22	a33	a44												
4		By increasing the load (small mass weight) and fixing the Angle of the aircraft tail (third gear) under full power operation, the flight speed and acceleration are measured	1、 5、 6	lift	Wing Angle 1 / load 1	Velocity, acceleration	Wing Angle 2 / load 1		Wing Angle 3 / load 1		Wing Angle 1 / load 2	Velocity					
														v1			
	acceleration													acceleration	acceleration	acceleration	

Experiment (trial)

The ornithopter can't keep the sensors flying

The core **acceleration** and **axis Angle** cannot be obtained, so it is difficult to build a model based on the remaining data

Attempted to replace the battery but could not determine circuit load

A lighter equivalent sensor could not be found

It is difficult to increase the load by breaking the existing structure
